Handling Recommendations: E+S Integrated Floating Hose

Storage

1. E+S Integrated Floating Hoses should be stored on a smooth and flat surface without using any additional timbers a. s. o.
   If the hoses have to be stacked they should be arranged in the form of a pyramid, also without any additional timbers.
   During storage, it will be favourable to protect the hoses from direct sunlight/UV-light and Ozone influences, which will help to protect the outer rubber cover against ageing.

2. As a lifting device, either a traverse with lifting Nylon belts (each 10° wide) or a spreader arrangement of 10° wide Nylon belts should be used to avoid puncturing the foam casing by high contact load (according to E+S-drawing no. 21-05-004).
